**Weaving Urban Voids**

**Disconnects Become Opportunities**

This proposal uses nature as the element that moves together the differences found on both sides of the railroad. By creating a systemic space shared and encompassed by the great variety of its surrounding residents, it addresses and promotes the sustainability for existing as a transit-oriented development. Although the proposal, the railroad and its industrial use for industrial purposes has been the considered in the design, nature is also able to provide a green zone that is both a common space and a recreational area where the pedestrian and public transportation becomes an opportunity for the residents. The created green space is together unique in the fact that it is treated as an infrastructure that supports the existing systems in the area. While the green space of the area has proven to be an opportunity for the temporary and permanent vacancies as it helps the role of recreational, commercial and vegetated space, it also has a very important role at the micro level. The objective of spaces that support the green space is a part of a system that is used to pump the reused grey water from the surrounding buildings to the elevated points in this way. With the design being based on a structural system that changes meaning based on the layers of materials placed upon it, it has the opportunity to evolve over time and in this way relate to its current users. 

**Temporary Commercial Space** Farmer’s Market

**Registration # S1076**
